Proposed Solution for Employee Spreadsheet Import

Proposed solution: use ServiceNow Load Data, an Import Set, a Transform Map with Employee ID coalesce, and built-in reports/dashboard to import, validate, and review spreadsheet-based employee data.

S.No.	Parameter	Description
1. 1	Problem statement	Employee data arrives in spreadsheets and must be loaded accurately. Repeated imports need to update matching IDs without adding duplicate employees.
2. 2	Solution description	Create Employee Test (u_employee_test) with five String fields. Load Sample Spreadsheet.xlsx to Employee Import (u_employee_import), transform with Sample Spreadsheet Import, map Name → Employee Name and the other four source fields by name, and coalesce on Employee ID.
3. 3	Data quality and validation	Review staged data, confirm source-to-target values in Employee Test, and inspect transform history. The documented four-row run inserted two new IDs and updated two existing IDs; an identical repeat ignored all four rows.
4. 4	Reporting and dashboard	Create Employees by Department (Pie/Count), Employees by Location (Bar/Count), and Employee List Report with all five fields. Add them to Employee Analytics Dashboard.
5. 5	Access and sharing	Share reports and dashboard with intended users, groups, or roles. Dashboard creation ACL adjustments are administrator-only and must follow the ServiceNow instance policy.
6. 6	Project boundary	The scope uses native ServiceNow capabilities and an XLSX workbook. External APIs, separate ETL tools, third-party BI, and machine learning are not specified.
