

Final Project Report

Import Data using Transform Maps (Spreadsheet) | Team SWTID-2026-7764 | 30 September 2026

Executive summary

The project implements a spreadsheet-to-ServiceNow employee data workflow using Import Sets, a Transform Map, Employee ID coalesce, three native reports, and a consolidated dashboard. The supplied walkthrough documents successful record insertion, update, and repeat-import behavior.

Objective and scope

Prepare a five-column spreadsheet; create Employee Test (u_employee_test) with five String fields; stage rows in Employee Import (u_employee_import); transform with Sample Spreadsheet Import; validate results; prevent duplicate inserts using Employee ID; and provide reports and a dashboard.

Implementation

Component	Configuration
Source	Sample Spreadsheet.xlsx; Employee ID, Employee Name, Email, Department, Location.
Target	Employee Test (u_employee_test); all five fields are String.
Staging	Employee Import; internal table u_employee_import.
Transform	Sample Spreadsheet Import; Employee Import to Employee Test; five same-name field maps.
Duplicate handling	Employee ID is enabled as the Coalesce field.
Analytics	Employees by Department (Pie/Count), Employees by Location (Bar/Count), Employee List Report.
Dashboard	Employee Analytics Dashboards; all three reports are added.

Observed import results

Run	Rows submitted	Inserted	Updated	Ignored
Four-row changed/new batch	4	2	2	Not reported
Same workbook repeated	4	0	0	4

The walkthrough describes two new Employee IDs and two existing IDs with changed test data in the first batch. Repeating the same file produced no additional inserts or updates and marked all four rows ignored.

Reports, sharing, and security

The dashboard consolidates employee counts by Department, employee counts by Location, and a detailed employee list. The walkthrough documents sharing with selected users, groups, or roles. It also describes an administrator-only pa_dashboards Create ACL setup with Admin Overrides; any ACL changes should be reviewed and applied through the instance's approved security process.

Limitations and remaining acceptance

The source provides no formal UAT signatures, actual performance timings, target instance URL, approved dashboard audience, or final review date. The Skill Wallet snapshot reports 50% overall and 50% on Milestone 1 only; it is a dated project snapshot, not final completion evidence.

Conclusion

The demonstrated workflow combines staged import, explicit field mapping, Employee ID coalesce, target validation, and built-in reporting. Attach sanitized configuration and run-history screenshots, confirm dashboard access, and complete formal acceptance before handover.
