1. Executive summary

This project demonstrates a repeatable spreadsheet-to-ServiceNow employee data workflow. A workbook with source columns Employee ID, Name, Email, Department, and Location is staged in Employee Import, mapped into the Employee Test schema, matched by Employee ID, and reviewed through three reports on Employee Analytics Dashboard.

2. Project scope

The supplied walkthrough covers nine implementation phases: prepare the spreadsheet; create the target table and fields; create the Import Set; configure the Transform Map; validate target records; enable Employee ID coalesce; re-import changed and new data; create reports; and add the reports to a dashboard.

The Skill Wallet dashboard groups the work into four milestones: spreadsheet/table setup; Import Set and Transform Map; transform, validation, and coalesce; reports and dashboard. Its supplied snapshot shows 50% overall progress and 50% for Milestone 1, with medium complexity, a 40-minute duration, and two stories. Treat these as the snapshot values, not a new status assessment.

3. Data model

Target table: Employee Test. Internal name: u_employee_test. All fields are Strings.

Employee ID — stable identifier and Transform Map Coalesce field.

Employee Name — employee display name.

Email — employee email value from the workbook.

Department — organizational department label.

Location — employee location label.

4. Source and staging

Source workbook: Sample Spreadsheet.xlsx, with headers Employee ID, Name, Email, Department, and Location. The walkthrough loads sheet 1 with header row 1. Map Name to Employee Name; the other four source headers

match the target fields by name.

```
Import Set label: Employee Import. Staging table name:
u_employee_import (auto-populated by ServiceNow). Review staged
rows before running the transform.
```

5. Transform configuration

Transform Map name: Sample Spreadsheet Import. Source table: Employee Import. Target table: Employee Test. Map Name → Employee Name and the other four fields by name. Use Mapping Assist to verify all five field maps.

Set Coalesce to true on the Employee ID field map. This gives the

transform a stable value to match against existing employee records.

6. Import and duplicate-handling results

The walkthrough reports a four-row follow-up import containing two new Employee IDs and two existing IDs with changed test values. Transform History showed two inserted records and two updated records.

The same four-row workbook was submitted again. Transform History showed zero inserted, zero updated, and four ignored rows. This demonstrates that the repeated submission did not create duplicate records for those Employee IDs.

7. Reports and dashboard

Employees by Department — Employee Test table; Pie chart; Group by Department; Aggregation Count.

Employees by Location — Employee Test table; Bar chart; Group by Location; Aggregation Count.

Employee List Report — Employee Test table; columns Employee ID,

Employee Name, Email, Department, and Location.

Dashboard name: Employee Analytics Dashboard. Add all three reports. The walkthrough

also shows sharing options for selected users, groups, or roles.

8. Access and administrative setup

The project walkthrough describes a ServiceNow pa_dashboards Create ACL with Admin Overrides enabled to permit dashboard creation through the backend form. This is an administrator-only instance setup detail, not a general user-access instruction. Apply only through the instance's approved security process, review the effective audience, and prefer supported dashboard creation controls when available.

Share the completed dashboard with the intended users, groups, or roles. Do not include credentials or unredacted personal test values in project evidence.

9. Validation and evidence

Retain screenshots of the target table and fields, staging load, five field maps, Employee ID Coalesce setting, transform success, Transform History for both runs, all three report configurations, dashboard composition, and sharing configuration.

The source walkthrough documents the import and configuration results. Formal test execution dates, reviewer names, final acceptance signatures, performance measurements, instance URL, and release approval were not provided and must be recorded by the team if required for submission.

10. Conclusion

The implementation links a structured spreadsheet to a ServiceNow custom table through Import Set staging and a Transform Map. Employee ID Coalesce supports repeatable updates; transform history supplies evidence; and department, location, and list reports provide a compact view of Employee Test records. The final handover should include the sanitized evidence and team sign-off.
